at the National Museum of the USAF**

WILBUR & ORVILLE WRIGHT

Wilbur Wright (1867-1912) was born near New Castle, Indiana and Orville was born in Dayton, Ohio; the third and fourth children of Milton and Susan Wright. They had two older brothers, Reuchlin and Lorin and a younger sister named Katharine. Their father was a bishop in the United Brethren Church and the family moved several times before settling in Dayton. The Wrights were successful bicycle makers. According to Orville Wright, their interest in aviation began in 1899.

"In the spring of the year 1899, our interest in the subject was aroused through the reading of a book on ornithology. We could not understand that there was anything about a bird that would enable it to fly that could not be built on a larger scale and used by man. At this time our thought pertained more particularly to gliding flight and soaring. If the bird's wings would sustain it in the air without use of any muscular effort we did not see why man could not be sustained by the same means. We knew that the Smithsonian Institution had been interested in some work on the problem of flight and, accordingly, on the 30th of May 1899, my brother Wilbur wrote a letter to the Smithsonian inquiring about publications on the subject."

Wilbur and Orville Wright

In August 1899, they built a two-wing kite with a five-foot span to test their idea of warping wings for lateral control. Based on the success of this kite, they built a 17 foot wide glider in September 1900 which they tested at Kitty Hawk, North Carolina. Although it was usually flown as a kite, several piloted free glides were made. However, it was not completely satisfactory because it often flew poorly and was difficult to control in a gusty wind.

The Wrights were greatly encouraged by their experience with their first glider and in 1901; they built a larger one with a 22 foot span. It followed the basic design of glider No.1 but also incorporated a pilot's hip-cradle for operating the wing-warping cables. The second glider was flown as Kitty Hawk in July and August 1901 on test glides up to 389 feet. However, its performance did not come up to expectations and for the first time, the Wrights began to question the validity of Otto Lilienthal's aerodynamic calculations they had been using. As a result, they decided to perfect their own mathematical tables for airfoil lift and drag.

Between September 1901 and August 1902, the Wrights developed and tested more than 50 airfoil sections in a home-made wind tunnel and on a modified bicycle. At last they had accurate data for building a third glider which was test flown at Kitty Hawk in the fall of 1902. Having a 32 foot span, it made nearly a thousand gliding flights. From it, the Wrights learned that to obtain adequate control in the air, they would need to install a movable rudder in place of the fixed rudders they had been using.

The Wrights were scientists first and aviators second. By 1903 they had solved two of the three basic problems associated with developing a successful flying machine – lift and control. The addition of a power source remained. In the summer of 1903, they built an airplane with a 40 foot, 4 inch wingspan which incorporated all the aerodynamic knowledge they had learned. While their mechanic, Charles Taylor, built a small, lightweight gasoline engine, they designed and built propellers, a significant feat in itself. On December 14, 1903, Wilbur attempted to fly the machine, but he over-corrected the elevator control and the airplane crashed. Three days later, on December 17, 1903, the machine had been repaired and Orville Wright made the world's first sustained, controlled, powered flight in a heavier-than-air aircraft.

During 1904 and 1905, the Wright continued their research into the mysteries of flight at Simms Station, now part of Wright-Patterson Air Force Base. In October 1905, however, they decided to discontinue their flying experiments until they had received the patent on their invention. Though this patent was not issued until May 22, 1906, the Wright offered their invention to the United States government on two occasions in 1905. Their offers were rejected for few people actually believed these two men had invented a successful flying machine. President Theodore Roosevelt heard of the Wrights and their flying machine in 1907 and directed the U.S. Army to investigate their claims of having flown. This interest led to meetings with the Wrights and on December 23, 1907, Specification No. 486 was issued for a "Heavier-than-Air flying machine." On February 10, 1908, the Signal Corps and the Wrights signed their contract

.Orville Wright brought the 1908 Flyer to Fort Myer, Virginia on August 20, 1908. Beginning on September 3rd, he made public flights almost daily and as the word spread, people flocked to Fort Myer in droves. On September 9th, he stayed aloft

over an hour, establishing a record, and later the same day he took Lt. Frank P. Lahm aloft. Lt. Lahm became the first Army officer to fly as a passenger. Tragedy struck during a flight on September 17th when the right propeller on the 1908 Flyer fouled a guy wire, causing the plane to crash to earth. Orville Wright was seriously injured, while the passenger Thomas E. Selfridge, was fatally injured.

On June 20, 1909, the Wrights returned to Washington with a new and somewhat improved airplane, the 1909 Flyer. Official trials began on July 27 when Orville Wright flew 1 hour, 12 minutes, 40 seconds with Lt. Lahm on board as an observer. The final trial flight was made on July 30 when Orville flew the airplane at an average speed of 42 ½ mph with Lt. Benjamin Foulois as observer. The 1909 Wright Flyer was formally accepted on August 2 and was designated as Signal Corps Airplane No.1, becoming the worlds' first military airplane.

FRANK P. LAHM **1877-1963**

Frank Lahm, born in Mansfield, Ohio, was the first man to be rateduyqiuwriqu a pilot in the United States Military Service. His solo flight was made with Orville Wright in 1909. He and Orville Wright also completed the first cross-country flight, a ten mile trip from Fort Myer, Virginia to Alexandria, Virginia and return. Lahm was the first airplane pilot and the first balloon pilot in the U.S. Army. He was graduated from the U.S. Military Academy in 1901, served in the Philippines for two years, and instructed at West Point. In 1905 he went to France to study aeronautics and a year later won the International Balloon Race from Paris to York County, England.

Frank Lahm

With the Signal Corps he investigated military aeronautics in France, England, Germany and Belgium. He was with the Office of the Chief Signal Officer's Aeronautics Division in Washington, D.C. when he began to fly. Prior to World War I he saw duty with the Cavalry and ran aviation schools. He went to Britain with the American Expeditionary Forces (AEF) in August 1917, and headed balloon outfits in the grade of captain. Lahm was on the First Army General Staff during the St. Mihiel and Muese-Argonne battles and later commanded the 1st and 2nd Army Air Services.

He later served on the War Department General Staff and was promoted to brigadier general in July 1926 as Assistant Chief of Air Corps. In 1930 he organized and commanded the Air Corps Training Center at San Antonio, Texas.

He was back in France by 1931 as Assistant Military Attaché for Air. Four years later he was Chief of Aviation for the First Army at Governors (SP) Island, New York and went to the Gulf Coast Air Corps Training Center at Randolph Field, Texas where he retired from active duty in 1941.

EDWARD V. RICKENBACKER 1890-1973

Eddie Rickenbacker

Columbus native Eddie Rickenbacker was a racing driver who went into World War I as a staff driver and emerged as the leading U.S. ace with 26 confirmed victories over the enemy. At his insistence he was permitted to join a flight unit, being assigned as a student at the Aviation Training School at Tours, France. In March 1918 he was assigned to the 1st Pursuit Group's 94th Aero Squadron, the famed "Hat-in-the-Ring Squadron," as a pilot under Major Raoul Lufbery. Rickenbacker was in action the next month, flying his Nieuport fighter over the lines against the enemy. On April 25th he shot down a German Pfalz. By June 1, 1918 Rickenbacker had become an ace, with five victories to his credit. He was put in command of the famed 94th Aero Squadron on September 25, 1918 and on October 28th received a promotion to captain. He continued as Hat-in-the-Ring Squadron leader until his return to the United States on January 27, 1919, when he was hailed as America's Ace of Aces with 26 victories. He was awarded the nation's highest honor, the Medal of Honor with the following citation:

"For conspicuous gallantry and intrepidity above and beyond the call of duty in citation against the enemy near Billy, France, September 25, 1918. While on a voluntary patrol over the lines, Lt. Rickenbacker attacked seven enemy planes (five type Fokker, protecting two type Halberstadt). Disregarding the odds against him, he dived on them and shot down one of the Fokkers out of control. He then attacked one of the Halberstadts and sent it down also."

After World War I he returned to auto racing and became president of the Indianapolis Speedway. In 1929 he took a colonel's commission as a Specialist in the Officers Reserve Corps, but he gave it up at the end of the five year appointment – he had often stated he always wanted to be remembered as "Captain Eddie."

During the early part of World War II he served as the personal observer of Secretary of War Henry L. Stimson to tour bases in England and seek out evidence of espionage. In October, 1942, leaving from Hawaii on a mission to

deliver a top secret message from Secretary Stimson to General Douglas MacArthur, Rickenbacker and his aide, Colonel Hans Adamson, boarded a B-17. Along with pilot Captain William Cherry, co-pilot Lieutenant James Whittaker, navigator John De Angelis, radio operator Sergeant James Reynolds and flight mechanics Private John Bartek and Sergeant Alex Kaczmarczyk, the B-17 took off for a refueling stop on Canton Island. Due to inadequate navigational equipment and a faulty weather report, the B-17 overshot its mark. Hundreds of miles off-course and out of fuel, Cherry ditched the plane in the Pacific.

The eight men lashed together the three rubber rafts so they would not get separated. They thought that rescue would come quickly because of Rickenbacker's fame, but they remained lost at sea for twenty-four days. Their meager supply of food ran out after three days, but on the eighth day a sea gull lighted on Rickenbacker's head. The bird became dinner and fishing bait. Navy pilots finally found and rescued the crew in the Ellice Island chain on Friday, November 13, 1942, more than 500 miles beyond Canton Island. Suffering from exposure, dehydration, and starvation, Rickenbacker rested a few days then proceeded on his original mission, including inspections at facilities at Port Moresby, Guadalcanal, and Upola. He reported to Secretary Stimson and General Arnold on December 19, and then returned to New York the following day where he was reunited with his family.

DON GENTILE

1920-1951

Don Gentile of Piqua learned to fly while a high school student. After graduation he tried to enlist in the Air Corps but was refused because he lacked the required two years of college (although he did have 300 hours flying time.) He turned to the Royal Air Force and by December 1941 became a Pilot Officer, flying with various RAF Squadrons out of England. In June 1942, he joined the famed British Eagle Squadron and on August 1, 1942 during the Dieppe raid, destroyed his first German planes, an FW-190 and a JU-88, within ten minutes of each other. In September 1942 Gentile was commissioned a second lieutenant in the Army Air Forces (AAF) and assigned to the 8th Air Force's 4th Fighter Group, flying with the 336th Squadron.

Don Gentile

AT the same time another young pilot, Captain John Godfrey transferred from the RAF to the AAF. He was assigned to the same squadron and became Gentile's wingman. The two formed a combination which General Hap Arnold praised as the greatest in any war. Unlike the usual wingman, Godfrey alternated with

Gentile as leader. Don Gentile is credited with shooting down a fraction less than 20 German planes and destroying six on the ground in 182 combat mission and 350 hours in the air. John Godfrey was credited with 18 enemy plane in the air, 18 on the ground, 5 probably destroyed, 12 damaged and 15 locomotives destroyed during 150 combat hours. Their teamwork against the German forces prompted Hermann Goring to be quoted as saying "I would gladly give two of my best squadrons for the capture of the Italian Gentile and the Englishman Godfrey." They earned high praise from President Roosevelt, Winton Churchill and General Arnold.

They were sent home to the United States in June 1944. After a series of war bond appearances together, they took different assignments. Gentile came to Wright-Patterson Air Force Base to test conventional fighters and F-80 jets, serving until December 1947 when he was assigned to the Training Division at US Air Force Headquarters for work on gunnery projects. He died in an airplane accident at Andrews, Air Force Base, Maryland in 1951.

GENERAL CURTIS E. LeMAY **1906-1990**

Curtis Emerson LeMay has been called the father of modern strategic bombing and is considered to be one of America's most famous air commanders. The Columbus native attended Columbus public schools and The Ohio State University, graduating with a bachelor's degree in civil engineering. In 1928 he

Curtis LeMay

entered the Armed Services as a flying cadet. He completed pilot training at Kelly Field, Texas, and was commissioned a second lieutenant in the Air Corps Reserve in October 1929. He received a regular commission on February. 1, 1930.

General LeMay's first tour of duty was with the 27th Pursuit Squadron at Selfridge Field, Mich. He served in various assignments in fighter operations before transferring to bomber aircraft in 1937.

General LeMay participated in the first mass flight of B-17 Flying Fortresses to South America in 1938.

This won for the 2nd Bomb Group the Mackay Trophy for outstanding aerial achievement. Prior to the United States' entry into World War II, General

LeMay pioneered air routes over the South Atlantic to Africa and over the North Atlantic to England.

General LeMay organized and trained the 305th Bombardment Group in 1942 and led that organization to combat in the European theater. He developed formation procedures and bombing techniques that were used by B-17 bomber

units throughout the European Theater of Operations. These fundamental procedures and techniques were later adapted to the B-29 Superfortresses that fought the war to its conclusion in the Pacific.

As commanding general of the Third Bombardment Division (England), he led the famed Regensburg raid -- a B-17 shuttle mission that originated in England, struck deep in Germany and terminated in Africa. In July 1944 he was transferred to the Pacific to direct the B-29 heavy bombardment activities of the 20th Bomber Command in the China-India-Burma theater. He later commanded the 21st Bomber Command with headquarters on Guam, and still later became chief of staff of the Strategic Air Forces in the Pacific. At the conclusion of World War II, he returned to the United States piloting a B-29 Superfortress on a nonstop, record flight from Hokkaido Island, Japan, to Chicago, Ill. He was then transferred to the Pentagon in Washington, D.C., to become the first Deputy Chief of Air Staff for Research and Development.

In October 1947 General LeMay was selected to command the U.S. Air Forces in Europe with headquarters at Wiesbaden, Germany. He organized air operations for the Berlin Airlift. A year later he returned to the United States, assumed command of the newly formed Strategic Air Command and established its headquarters at Offutt Air Force Base, Neb. This central location was to become the nerve center of a worldwide bomber-missile force.

Commanding SAC for nearly nine years, he built, from the remnants of WWII, an all-jet bomber force, manned and supported by professional airmen dedicated to the preservation of peace. Under his leadership and supervision, plans were laid for the development and integration of an intercontinental ballistic missile capability.

To improve bombing accuracy, LeMay initiated straight-in bomb runs and formation patterns, new techniques and procedures which were eventually used by all B-17 "Flying Fortress" bomber units throughout the European theater, and later by the B-29 "Superfortress" bombers against Japan. He commanded the 3rd Bomb Division and led it on the famed Regensburg raid, a B-17 shuttle mission that originated in England, struck deep in Germany and terminated in Africa. After promotion to major general in 1944, Curtis LeMay was transferred to the Pacific and later became Chief of Staff of the Strategic Air Forces in the Pacific. In the B-29 operations from the Mariana Islands, LeMay made the decision to strip the B-29, which was built for high-altitude mission, down to lighter weight for low-level round-trip night attacks on Japan, armed with fire bombs. Using this technique on March 9, 1945, a force of 335 B-29s destroyed a large portion of Tokyo and the industrial area. These four bomb raids contributed to the rapid defeat of Japan.

After the war, he was assigned to Washington, D.C and in October 1947 was promoted to lieutenant general and named Commander of USAFE (United States

Air Force in Europe). He organized air operations for the Berlin Airlift in 1948. In 1949 he returned to the United States to head the Strategic Air Command (SAC). He was promoted to full general in October 1951. In nine years as the SAC commander, he built it into the worlds' most powerful deterrent force. He saw the possibility of the use of intercontinental ballistic missile to complement the role of the bomber and helped lay the plans for their development.

In July 1957, General LeMay was appointed Vice Chief of Staff of the United States Air Force and helped direct the missile and military space program. He served a Chief of Staff of the United States Air Force from 1961 to 1965.

General LeMay received the Distinguished Service Cross, the Distinguished Service Medal with two oak leaf clusters, the Distinguished Flying Cross with two clusters and the Air Medal with three clusters.

JOHN H. GLENN, JR 1921-

John H. Glenn, Jr. was born in Cambridge, Ohio and grew up in New Concord, Ohio. In John Glenn's long aviation career, he flew with the U.S. Marines and the U.S. Air Force, set a speed record, and shot down enemy aircraft. But he is best known as the first American to orbit the earth and, later in life, as the oldest person to fly in space. In World War II, Glenn volunteered for naval aviation training and became a Marine pilot. He flew 59 combat missions in F4U Corsair fighters and received the Distinguished Flying Cross (DFC) and two Air Medals. In the Korean War, he was one of a handful of Marines selected to fly USAF F-86 Sabre jets in a pilot exchange program. Glenn shot down three North Korean MiG-15 fighters and soon became known as the "MiG Mad Marine." He flew 27 of his 90 missions in USAF jets, earning another DFC and eight Air Medals. Following the war, Glenn became known as the first "supersonic Marine." He set a speed record flying a Chance Vought F8U Crusader coast-to-coast across the United States in 3 hours, 23 minutes, 8.4 seconds in July 1957. His average speed was 723.52 mph or Mach 1.1, bettering the previous coast to coast records by 21 minutes.

John Glenn

In April 1959 he was selected as one of the original seven Project Mercury astronauts. On February 20, 1962, Glenn piloted the Mercury-Atlas 6 "Friendship 7" spacecraft on the first manned orbital mission of the United States. Launched from Kennedy Space Center, Florida, he completed a successful three-orbit

mission around the earth, reaching a maximum altitude (apogee) of approximately 162 statute miles and an orbital velocity of approximately 17,500 miles per hour. Glenn's "Friendship 7" Mercury spacecraft landed approximately 800 miles southeast of KSC in the vicinity of Grand Turk Island. Mission duration from launch to impact was 4 hours, 55 minutes, and 23 seconds. The USAF's Atlas rocket made his historic flight possible. At that time, the Atlas was the only booster powerful enough to put the Mercury spacecraft into orbit. Colonel Glenn also served as U.S. Senator from Ohio for 4 terms.

On October 29, 1998, the first American to orbit the Earth made history again. John Glenn became the oldest man to fly in space by serving as a payload specialist on STS-95 aboard the space shuttle Discovery. Glenn spent most of his time in space participating in investigations on the aging process. Scientists recognize several parallels between the effects of spaceflight on the human body and the natural changes that take place as a person ages. Glenn's experiments were designed to test how his body responded to the microgravity environment. They focused on balance, perception, immune system response, bone and muscle density, metabolism, blood flow and sleep

NEIL ARMSTRONG

1930-

Neil A. Armstrong, of Wapakoneta, Ohio, took his first plane ride in a Ford Tri-Motor at the age of 6. He developed an interest in aviation and astronomy and earned his private pilot's license at age 16, before he learned to drive an automobile. In 1947 he entered Purdue University majoring in aeronautical engineering. In 1949, the United States Navy called him to active duty. He became a Navy pilot and served during the Korean War, flying 78 combat missions in Navy Panther jets.

Neil Armstrong

Armstrong returned to Purdue University in 1952, earning a bachelor's degree in aeronautical engineering in 1955. He then joined NASA's Lewis Research Center and later transferred to the NASA High Speed Flight Station (now NASA's Dryden Flight Research Center) at Edwards Air Force Base, California, as an aeronautical research pilot. In this capacity, he performed as an X-15 project pilot. He reached the altitude of 207,500 feet and the speed of 3,989 (Mach 4). He made seven flights in the X-15 rocket plane between December 1960 and July 1962. Other flight test work included piloting the X-1, F-100, F-101, F-102, F-104, B-47 and others. He had a total of over 2450 flying hours by the time he left Dryden. Before it was cancelled

Armstrong was a member of the USAF-NASA Dyna-Soar Pilot Consultant Group. He studied the X-20 Dyna-Soar approaches and abort maneuvers using F-102A and F5D aircraft.

Armstrong was selected as the first civilian astronaut by NASA in September 1962. He served as back-up command pilot for the Gemini V flight, As command pilot for the Gemini XIII mission, launched on March 16, 1966, he performed the first successful docking of two vehicles in space- the Gemini spacecraft and the Agena Target Vehicle, After having completed a perfect linkup, the Gemini VIII capsule, still docked to the Agena, began rolling continuously. Never having faced this in simulation, the crew undocked from the Agena. The problem was a stuck thruster on the spacecraft, which now tumbled even faster at the dizzying rate of one revolution per second. The only way to stop the motion was to use the capsule's reentry control thrusters, which meant that Armstrong and crew member David Scott had to cut short their mission and make an emergency return to Earth 10 hours after launch. He subsequently served as backup command pilot for the Gemini XI mission and was backup commander on Apollo VIII.

Neil Armstrong was the commander for Apollo XI from July 16-24, 1969 – the first manned lunar landing mission. He holds the distinction of being the first man to walk on the moon. On July 20, 1969 A Lunar Module camera provided live television coverage of Armstrong setting foot on the lunar surface at 10:56 p.m. EDT. Just as he stepped off the Lunar Module Neil Armstrong proclaimed, "That's one small step for a man, one giant leap for mankind." Lunar module pilot, Buzz Aldrin emerged soon after, setting foot on the lunar surface at 11:16 p.m. They completed a 2 hour and 40 minute extravehicular activity which resulted in the collection of lunar surface samples, the deployment of lunar surface experiments and an extensive evaluation of the life supporting extravehicular mobility unit. Following completion of their activities, they maneuvered the lunar module to a rendezvous with command module pilot Michael Collins who had remained in lunar orbit in the command module.

Armstrong resigned from the United States astronaut program in 1970. He earned a master's degree in aerospace engineering at the University of Southern California in 1970 and was a professor of aerospace engineering at the University of Cincinnati from 1971-1979. In 1986, he was named vice chairman of a presidential commission investigating the breakup of the space shuttle Challenger.

WILLIAM PITSENBARGER 1944-1966

Born in 1944 in Piqua, Ohio, William H. Pitsenbarger was an ambitious only child. He wanted to quit high school to join the U.S. Army Special Forces' "Green

Berets," but his parents convinced him to stay in school. After graduating in 1962, Pitsenbarger joined the Air Force.

A1C Pitsenbarger learned his military skills in a series of demanding schools. After Air Force basic training, he volunteered for pararescue work and embarked on a rigorous training program, which included U.S. Army parachute school, survival school, a rescue and survival medical course, and the U.S. Navy's scuba diving school. More Air Force rescue training and jungle survival school followed. His final training was in air crash rescue and firefighting, with assignment to the HH-43 Huskie helicopter.

William Pitsenbarger

Arriving in Vietnam in August 1965, Pitsenbarger completed more than 250 missions, including one in which he hung from an HH-43's cable to rescue a wounded South Vietnamese soldier from a burning minefield. This action earned him the Airman's Medal and the Republic of Vietnam's Medal of Military Merit and Gallantry Cross with Bronze Palm.

William H. Pitsenbarger was only 21 years old when he was killed in action. But in his short life and valorous Air Force career, he was an example of dedication, compassion and tenacity for all those with whom he served. In his work, and especially on his final mission, A1C Pitsenbarger embodied the pararescueman's motto: "That Others May Live."

The Last Mission

"There was only one man on the ground that day that would have turned down a ride out of that hellhole -- and that man was Pitsenbarger."

- F. David Peters, Charlie Company, 2nd Battalion, 16th Infantry, 1st Infantry Division

In Vietnam A1C William H. "Bill" Pitsenbarger gave his life so that others might live. A pararescueman, Pitsenbarger saved lives in an example of selfless heroism worthy of the Medal of Honor.

On April 11, 1966, in thick jungle near Saigon, an infantry company on 134 soldiers from the 1st Infantry Division (the "Big Red One") was surrounded by a Viet Cong battalion of approximately 500 troops. In a fierce firefight, the North Vietnamese surrounded and pinned down the Americans. As the battle went on, the number of U.S. casualties grew steadily.

Detachment 6 of the USAF's 38th Aerospace Rescue and Recovery Squadron

received an urgent call to evacuate the wounded. Army helicopters could not land in the battle zone because there were no clearings in the tall, dense "triple canopy" forest. The tallest trees rose 150 feet, and a second layer stood at about 100 feet, with a third layer below. Only U.S. Air Force HH-43 Huskie helicopters with cables and winches could hoist the injured from the jungle.

Airman Pitsenbarger was the rescue and survival specialist aboard "Pedro 73," one of the two Huskies on the mission. The Huskies were to take turns hoisting litters with critically wounded patients through the forest canopy and delivering them to a nearby airfield. Pedro 73's crew, while under fire and hovering in a hole in the forest below the tallest trees and barely large enough for the Huskie, saw that the ground troops desperately needed help loading wounded into the litter. Pitsenbarger volunteered to be lowered to the ground to help. He descended a hundred feet into the firefight with a medical bag, a supply of splints, a rifle and a pistol.

On the ground, Pitsenbarger organized and speeded the evacuation, enabling the Huskies to rescue nine soldiers on several trips. Normally, pararescuemen return to the helicopter, but Pitsenbarger chose to stay and help the beleaguered troops. As the fight continued, Pedro 73 was badly damaged by ground fire and forced to withdraw. Rather than escape with the last Huskie, Pitsenbarger chose to stay on the ground and aid the wounded. Soon the firefight grew too intense for the helicopters to return.

As darkness fell, Pitsenbarger not only cared for the wounded, but also collected and distributed ammunition to the surviving soldiers several times under enemy fire. In the early evening he was mortally wounded fighting alongside the remaining infantrymen. The Viet Cong withdrew during the night, and the following morning U.S. forces were able to recover survivors and the fallen. Charlie Company had suffered 80 percent casualties.

For coordinating the successful rescues, caring for the wounded and sacrificing his life while aggressively defending his comrades, William H. Pitsenbarger received the Air Force Cross on June 30, 1966. After review, the original award was upgraded, and on Dec. 8, 2000, the Medal of Honor was presented to his family in a ceremony at the U.S. Air Force Museum. Airman Pitsenbarger is the 59th Medal of Honor recipient, and sixth enlisted recipient, from the Air Force and its predecessor organizations.
